Zheng Wenjing (3036197615)

10th March 2024

1 Overview / Case Summary

On the 29th of October 2022, at approximately 3:00 p.m., the Intrusion Detection System (IDS) of the Bank of Hong Kong flagged abnormal network activities aimed at the Bank's web server. This prompted an immediate and thorough examination, leading to the suspicion of a deliberate cyber-attack. As the appointed network security engineers, our task was to investigate these anomalies, analyze network traffic, and reconstruct the whole attack.

2 Objective/Tools Used/Evidence Map & Table

The primary objective of this forensic investigation is to analyze the pcap file to identify suspicious activities and reconstruct the events that occurred during the attack. Wireshark is used for packet inspection. The Evidence Map and Table, provided in Appendix A, organizes the evidence collected during the investigation. The evidence hash and base information are provided in Appendix B.

3 Investigation on Attack

3.1 Hosts List

The analysis of the pcap file revealed several hosts with a substantial amount of network traffic, constituting more than 1% of the captured packets. The details of these hosts, including IP and MAC addresses, are tabulated as follows.

Table 1: Hosts with Significant Network Traffic

IP Address	MAC Address	Count	Rate (ms)	Percent	Burst Rate	Burst Start
All Addresses	—	744827	3.4890	100%	7.4300	6.635
192.168.93.131	00:0c:29:db:d0:dc	410761	1.9242	55.15%	7.4300	6.635
192.168.56.1	00:23:ae:74:d0:5e / 00:50:56:e0:26:7f (This is MAC address of router 192.168.93.2)	408635	1.9142	54.86%	7.4200	6.635
147.8.178.220	90:b1:1c:84:73:43	330518	1.5483	44.38%	2.7900	147.695
147.8.178.218	90:b1:1c:80:23:c4	330193	1.5467	44.33%	2.3400	154.870

3.2 Attack Classification

In the obtained pcap file, two kinds of Denial of Service (DoS) attacks are prevalent, namely: UDP flood, and ICMP flood.

3.2.1 UDP Flood

The UDP flood attack is a form of DoS attack in which an attacker sends a large number of User Datagram Protocol (UDP) packets to a target's system in an attempt to consume enough server resources to make the system unresponsive to legitimate traffic.

The I/O graph of the UDP flood attack is shown in Figure 1.

Figure 1: I/O Graph of UDP Flood Attack

Analysis of the pcap file revealed that the attacker 147.8.178.218 dispatched 330,192 UDP packets of uniform size to port 8888 on the victim's system 147.8.178.220. Each packet contributed to a cumulative data volume of 20MB. The assault commenced at 12.401672 seconds (Oct 29, 2022 15:16:46.938460000 HKT), enduring for 168.6530 seconds, with UDP packets being sent at intervals ranging from 0.0005 to 0.001 seconds.

This is a typical UDP flood attack, which is so intense that it comprises 44.1% of the total network traffic.

However, the target system 147.8.178.220 still was able to respond to other network traffic during and after the attack.

3.2.2 ICMP Flood

The ICMP flood attack is a form of DoS attack in which an attacker aims to overwhelm a target's system by flooding it with ICMP echo-requests.

The I/O graph of request packets of the ICMP flood attack is shown in Figure 2.

Figure 2: I/O Graph of ICMP Flood Attack (Request Packets)

The I/O graph of reply packets of the ICMP flood attack is shown in Figure 3.

Figure 3: I/O Graph of ICMP Flood Attack (Reply Packets)

Combine the I/O graphs of request and reply packets to observe to which extent the two graphs above are overlapping, the graph is shown in Figure 4.

Figure 4: I/O Graph of ICMP Flood Attack (Combined)

The pcap file revealed that the attacker 192.168.93.131 sent 408,614 ICMP packets to the victim's system 192.168.56.1. The ICMP flood attack commenced at 6.589908 seconds (Oct 29, 2022 15:16:41.126696000 HKT), lasting for 195.7510 seconds, with a total of 17MB data transmitted over the network. The rate of ICMP request and reply packets fluctuated between 1,000 to 4,000 per second, peaking at nearly 6,000 packets per second. Interestingly, the frequency of reply packets per second did not significantly increase as the attack progressed. A comparison of the input/output graph for the number of request packets per second over time with that of the reply packets per second reveals a substantial overlap, indicating no notable impact on the victim. Further analysis of the evidence table reveals that the IP address 192.168.93.2 serves as the router for the subnet 192.168.93.0/24. This observation suggests that the router remained operational and unaffected by the attack.

3.3 Other Suspicious Activities

In the obtained pcap file, several suspicious activities, which are not as severe as the aforementioned flood attacks but still worth noting, were observed. These activities can be categorized into the following types, if they become much more intense:

- SYN Flood
- TCP FIN PSH ACK Flood
- SSDP Misconfiguration

3.3.1 SYN Flood

The SYN flood attack is a form of DoS attack in which an attacker sends a succession of SYN requests to a target's system in an attempt to consume enough server resources to make the system unresponsive to legitimate traffic.

The I/O graph of the SYN flood attack is shown in Figure 5.

Figure 5: I/O Graph of SYN Flood Attack

Based on the packet captures, the SYN flood attack was observed from the IP address 147.8.178.107 to 147.8.178.220. In total of 60 packets (4 kB) were sent from 147.8.178.107, starting from 4.969162s, during a duration of 199.2520s. The TCP SYN packets were directed towards ports 9990 and 9991. Initially, a packet originated from port 58274 to port 9990, followed approximately 0.1 seconds later by another packet from port 58275 to port 9991. Subsequently, a 3-second pause was observed before the attacker dispatched two identical packets in the same sequence. This pattern was repeated after a 6-second interval. Eventually, the attacker executed the aforementioned sequence again following a 12-second delay. This activity was consistently performed ten times, spanning from October 29, 2022, at 15:16:39.505950000 HKT to October 29, 2022, at 15:19:58.757932000 HKT.

However, this attack was not intense enough to cause a significant impact on the target system. As based on the information obtained from the packet captures, the target system 147.8.178.220 still responded to other network traffic during the attack. The pattern of the attack resembles a normal network traffic pattern. There's a chance that the target system was running a service that was listening to the targeted ports previously. Out of some reason, these ports were no longer in use, and the attacker's system was still trying to connect to these ports.

In a nutshell, the suspicious SYN flood attack was not successful in causing a significant impact on the target system. It might very well be a false positive.

3.3.2 TCP FIN PSH ACK Flood

The TCP FIN PSH ACK flood attack has similar characteristics to the TCP SYN flood attack.

The I/O graph of the TCP FIN PSH ACK flood attack is shown in Figure 6.

Figure 6: I/O Graph of TCP FIN PSH ACK Flood Attack

The IP address 147.8.179.15:80 was observed transmitting TCP [FIN, PSH, ACK] packets to 192.168.93.131:49159, starting from October 29, 2022, at 15:16:34.536788000 UTC until October 29, 2022, at 15:20:07.993527000 HKT, with a packet sent every 0.1 seconds, totaling 2,132 packets. No response was received from the receiver.

This pattern of persistent retransmissions could imply several underlying issues:

1. **Lack of Acknowledgment:** The continuous retransmission of [FIN, PSH, ACK] packets might suggest that the sender is not receiving the expected acknowledgment from the receiver. Normally, following a [FIN, ACK] transmission, a corresponding [FIN, ACK] reply from the receiver is anticipated, concluding with an [ACK] from the sender to gracefully terminate the connection. If the sender persistently retransmits the [FIN, PSH, ACK] packet, it may indicate the absence or mishandling of the final acknowledgment from the receiver.
2. **Network Issues:** Frequent retransmissions may also signal network-related problems such as congestion, high latency, or packet loss, potentially causing repeated packet losses, including acknowledgments, and forcing the sender to retransmit to ensure proper connection closure.
3. **Configuration Errors or Software Bugs:** The observed behavior could stem from network device misconfigurations or software bugs affecting TCP connection management, e.g., issues in NAT devices, firewalls, or the TCP stack leading to incorrect TCP teardown handling.
4. **Potential Malicious Activity:** Such patterns might indicate malicious attempts, like a denial-of-service (DoS) attack.

Despite these anomalies, the router and 192.168.93.131 appeared unaffected, as other activities on 192.168.93.131 proceeded normally.

3.3.3 SSDP Misconfiguration

An SSDP (Simple Service Discovery Protocol) flood attack is a type of Distributed Denial of Service (DDoS) attack. It exploits the SSDP protocol, which is used for the discovery of UPnP (Universal Plug and Play) devices on a network. Attackers send a large number of SSDP discovery requests to a target's network using spoofed IP addresses. These requests are directed at UPnP devices, which then respond to the spoofed addresses, overwhelming the target with traffic and potentially causing disruption or denial of service.

However, in this case, there were massive SSDP NOTIFY messages sent by the QQ Music application. If the attacker chose to launch an attack in this way, it would be an inefficient way to do so.

The I/O graph of the suspicious SSDP traffic is shown in Figure 7.

Figure 7: I/O Graph of SSDP Packets Related to QQ Music Application

The suspicious activity, identified as SSDP misconfiguration, commenced on October 29, 2022, at 15:16:41.762146000 HKT, with the source 147.8.179.159 dispatching SSDP NOTIFY packets at 20-second intervals, releasing 14 packets with each instance. This episode concluded on October 29, 2022, at 15:20:01.853385000 HKT.

The QQ Music application's frequency of SSDP NOTIFY message transmission significantly exceeded that of other devices. This pattern could either indicate a normal behavior for the QQ Music application, characterized by a high frequency of SSDP NOTIFY message transmission, or represent the app was misconfigured.

3.4 Victim Information

Based on the Attack Classification section 3.2, the victim of UDP flood attack is 147.8.178.220, it's a Dell device, with MAC address 90:b1:1c:84:73:43. The victim of ICMP flood attack is 192.168.56.1, it's a Windows XP virtual machine with MAC address 00:23:ae:74:d0:5e.

3.5 Attacker Information

One attacker's IP addresses is 147.8.178.218, suspected to be the source of the UDP flood attack. It's a Dell device with MAC address 90:b1:1c:80:23:c4.

Another attacker's IP address is 192.168.93.131, suspected to be the source of the ICMP flood attack. It's a virtual machine with MAC address 00:0c:29:db:d0:dc. It's host name is WIN-0GR9LTN6K0J.localdomain.

4 Investigative Reconstruction

Upon scrutinizing the sequence of network events, a timeline of the attack was reconstructed, revealing the methods and progression of the malicious activities. This reconstruction is crucial for understanding the attack's impact and for developing future mitigation strategies.

At Oct 29, 2022 15:16:41.126696000 HKT, the ICMP flood attack was initiated by the attacker 192.168.93.131, targeting the victim 192.168.56.1. This attack lasted for 195.7510 seconds.

At Oct 29, 2022 15:16:46.938460000 HKT, the UDP flood attack was initiated by the attacker 147.8.178.218, targeting the victim 147.8.178.220. This attack lasted for 168.6530 seconds.

There're also other suspicious activities, such as SYN flood, TCP FIN PSH ACK flood, and excessive NOTIFY messages ascribed to SSDP misconfiguration. However, these activities were not as severe as the aforementioned flood attacks.

Except for the devices involved in the attacks, other devices in the network were not affected by the attacks and operated normally.

Appendix A

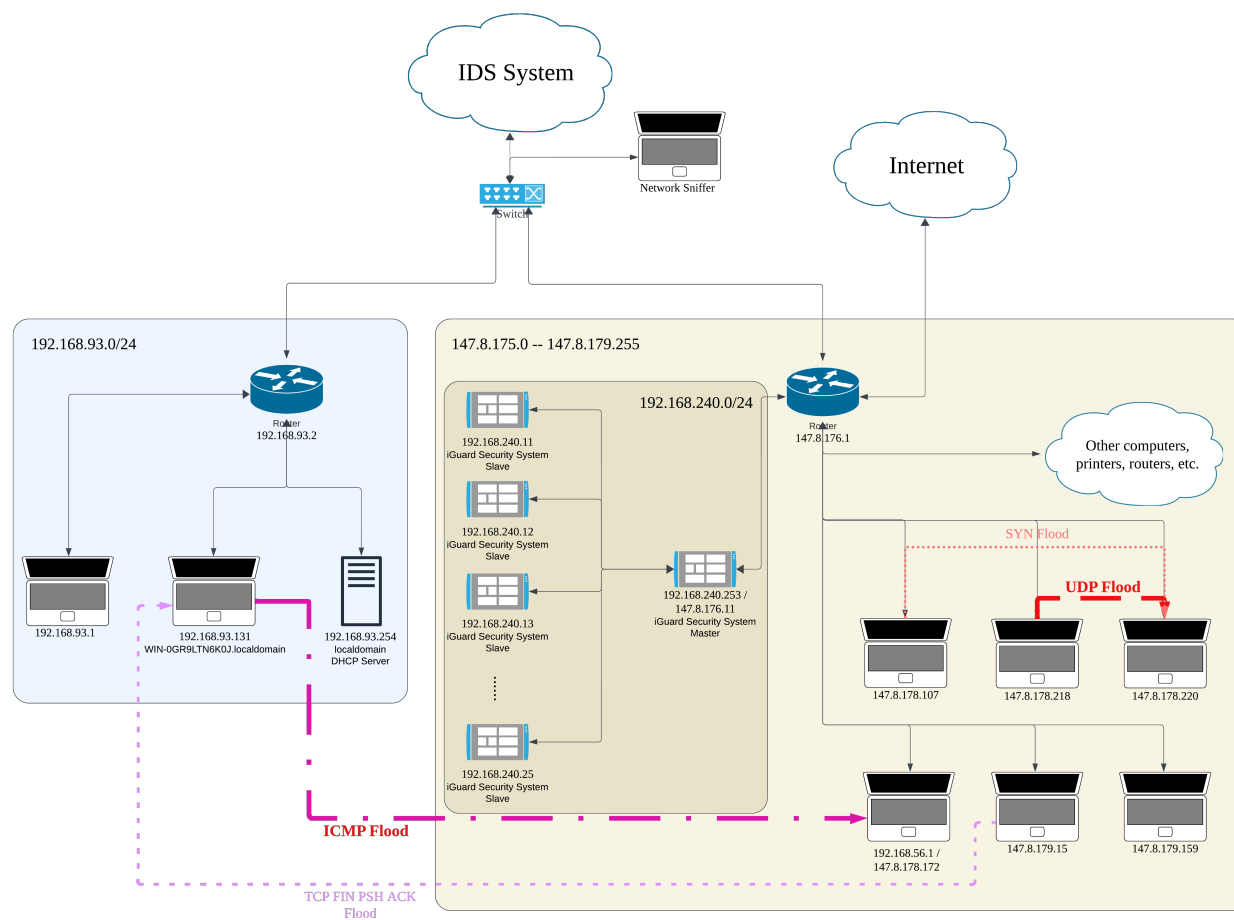

Figure 8: Evidence Map (Network Topology)

Table 2: Evidence Table (Private IP Addresses)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
192.168.56.1 or 147.8.178.172	ATHENA	Server Type: 0x00011007 (Workstation, Server, SQL, NT Workstation, Potential Browser)	Keep getting ICMP request from 192.168.93.131 / Keep getting 0x19(FIN, PSH, ACK) TCP packets in port 49159 from 147.8.179.15:80	Windows XP (5.1) / VMware	1

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.176.12	–	–	Referred by ARP broadcast (reply to 147.8.176.15) from source MAC address 00:14:4f:02:06:42, this IP and 147.8.178.15 belong to the same device	Oracle device	3
147.8.176.15	–	DNS server	DNS queries and responses	A DNS server from Newisys, Inc.	3
147.8.176.22	c316a2.local	Supporting the LPD protocol (port 515) for printing / raw printing via the PDL data stream (port 9100) / IPP (port 631)	Messages using mDNS	HP LaserJet P3010 Series printer	3
147.8.176.23	c316b.local	Supporting the LPD protocol (port 515) for printing / raw printing via the PDL data stream (port 9100) / Sending additional details	Messages using mDNS	HP Color LaserJet 4650 printer	3
147.8.176.26	c405c.local	Supporting raw printing via the PDL data stream (port 9100)	Messages using mDNS	HP Color LaserJet CP3505 printer	3
147.8.176.27	c405b.local	Supporting raw printing via the PDL data stream (port 9100)	Messages using mDNS	HP LaserJet P3005 printer	3
147.8.176.28	c405a.local	Printer	Messages using mDNS	HP LaserJet 8150 Series	3
147.8.176.40	–	Announcement about domain CB315 and Master Browser Server Name (DVR315)	Message using BROWSER protocol	Device from QUANTUM DESIGNS (H.K.) LTD.	3
147.8.176.44	SMART315	Server Type: 0x00001003, Workstation, Server, NT Workstation	Message using BROWSER protocol	Windows XP / iGuard API Server	3

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.176.46	–	–	Referred by ARP broadcast (requested by 147.8.176.12)	–	3
147.8.176.55	–	Router	UPnP Device Description transmitted in TCP stream 3	Wireless Router TL-WR740	3
147.8.176.56	PROMISE	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser	Messages using BROWSER protocol	Dell device	3
147.8.176.75	Photo-NAS.local	NAS device	Message using mDNS	NAS from Synology Incorporated	3
147.8.176.77	–	Searching for multiple names (e.g., HKUCS, CB411-COMPVISIO)	Messages using SSDP	Device from PCS Systemtechnik	3
147.8.176.80	CSEX	Server Type: 0x0084102b, Workstation, Server, Domain Controller, Time Source, NT Workstation, Master Browser, DFS	Local Master Announcement using BROWSER	Windows Server 2003 R2 or Windows Server 2003 / Dell device	3
147.8.176.112	TESTINGICDFI-PC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser	Host Announcement using BROWSER	Windows 7 or Windows Server 2008 R2 / Dell device	3
147.8.176.114	–	Searching for KWCCHAN-PC (Domain Controller)	Message using NBNS	–	3
147.8.176.118	–	Running SSH on port 22	SSH connection from 147.8.178.254	–	3
147.8.176.145	–	–	Requesting for 147.8.176.146 using ARP request	–	3

Continued on next page

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.176.146	–	–	Wanted by 147.8.176.145 through ARP request	–	3
147.8.176.196	–	–	Referred by ARP broadcast (requested by 147.8.178.15)	–	3
147.8.176.197	KMBT69E8F2	Server Type: 0x00000303, Workstation, Server, Member, Print	Host Announcement using BROWSER	Printer from KONICA MINOLTA HOLDINGS, INC.	3
147.8.176.199	–	Searching for a Internet Gateway Device	Messages using SSDP	MSI device	3
147.8.176.221	lg102-pschan	Using Dropbox's LAN sync feature / Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser	Messages using Dropbox LAN Sync Discovery Protocol / Host Announcement using BROWSER	HP device / Windows 7 or Windows Server 2008 R2	3
147.8.177.19	CSISNAS2	Server Type: 0x00869007, Workstation, Server, SQL, NT Workstation, NT Server, Backup Browser, Master Browser, DFS	Local Master Announcement using BROWSER	Windows Server 2003 R2 or Windows Server 2003 / Device from BUF-FALO.INC	3
147.8.177.21	TESTTWINS2012	Server Type: 0x00009007, Workstation, Server, SQL, NT Workstation, NT Server	Host Announcement using BROWSER	Windows 7 or Windows Server 2008 R2 / Device from PCS Systemtechnik	3

Continued on next page

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.177.22	–	Querying about CSISNAS2(Server Service)	Message using NBNS	Device from PCS Systemtechnik	3
147.8.177.24	TFWONGATCECID	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser / Searching for Internet Gateway Device	Host Announcement using BROWSER / SSDP search messages	Windows 7 / Dell device	3
147.8.177.25	–	–	Referred by ARP broadcast (requested by 147.8.178.15)	–	3
147.8.177.28	NPI39E91F.local	Printer	Messages using mDNS	HP LaserJet 2300 series	3
147.8.177.29	YXFANGPC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser	Host Announcement using BROWSER / Messages using Dropbox LAN Sync Discovery Protocol	HP device / Windows 7 or Windows Server 2008 R2	3
147.8.177.37	CPMENGPC	Server Type: 0x00011007, Workstation, Server, SQL, NT Workstation, Potential Browser / Using Dropbox's LAN sync feature	Host Announcement using BROWSER / Messages using Dropbox LAN Sync Discovery Protocol	HP device / Windows 7 or Windows Server 2008 R2	3
147.8.177.42	–	Searching for media server / media renderer	Messages using SSDP	HP device	3
147.8.177.51	–	Notifying the network that this is a media server / content directory / connection manager	SSDP Notify messages	Windows 8.1 / Dell device	3
147.8.177.54	ARLIN	Server Type: 0x00011007, Workstation, Server, SQL, NT Workstation, Potential Browser / Using Dropbox's LAN sync feature	Host Announcement using BROWSER / Messages using Dropbox LAN Sync Discovery Protocol	HP device / Windows 7 or Windows Server 2008 R2	3

147.8.178.253	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	MSI device	3
147.8.178.254	–	Running application using SSH	SSH connection to 147.8.176.118	HP device	3
147.8.179.15	–	Sending high volume of TCP FIN PSH ACK packets to 192.168.93.131	Multiple TCP FIN PSH ACK packets	–	2
147.8.179.42	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	MSI device	3
147.8.179.46	–	–	Referred by ARP broadcast (requested by 147.8.178.15)	–	3
147.8.179.48	–	–	Referred by ARP broadcast (requested by 147.8.178.15)	–	3
147.8.179.53	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	MSI device	3
147.8.179.56	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	Dell device	3
147.8.179.74	–	–	–	Dell device	3
147.8.179.81	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	Device from Universal Global Scientific Industrial Co., Ltd.	3
147.8.179.82	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	Dell device	3

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.179.84	–	Using Dropbox's LAN sync feature / Sending SSDP discovery request for a device that is the root of a device tree / Sending messages to probable HP printers	Messages using Dropbox LAN Sync Discovery Protocol and SSDP / UDP broadcast to port 3702	Dell device	3
147.8.179.105	–	–	SSDP notify messages	Linux / Network camera (or gateway) from fitivision technology Inc.	3
147.8.179.106	–	–	SSDP notify messages	Linux / Network camera (or gateway) from fitivision technology Inc.	3
147.8.179.131	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	Dell device	3
147.8.179.140	–	Using Dropbox's LAN sync feature / Sending SSDP discovery request for a device that is the root of a device tree / Sending messages to probable HP printers	Messages using Dropbox LAN Sync Discovery Protocol and SSDP / UDP broadcast to port 3702	Dell device	3
147.8.179.141	–	Media server	SSDP messages	MSI device	3

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.179.144	–	Announcement about domain WORKGROUP and Master Browser Server Name (PEREA) / Sending messages to probable HP printers	Message using BROWSER protocol / UDP broadcast to port 3702	MSI device	3
147.8.179.150	ZYLUPC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser / Using Dropbox's LAN sync feature	Host Announcement using BROWSER / Messages using Dropbox LAN Sync Discovery Protocol	HP device / Windows 7 or Windows Server 2008 R2	3
147.8.179.151	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	MSI device	3
147.8.179.153	CZHANG2PC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser	Host Announcement using BROWSER	Windows 7 or Windows Server 2008 R2 / HP device	3
147.8.179.156	XMCUIPC	Server Type: 0x00011203, Workstation, Server, Print, NT Workstation, Potential Browser	Host Announcement using BROWSER	Windows 7 or Windows Server 2008 R2 / HP device	3
147.8.179.157	CYYEUNGPC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser / Sending messages to probable HP printers	Host Announcement using BROWSER / UDP broadcast to port 3702	Windows 7 or Windows Server 2008 R2 / HP device	3
147.8.179.158	FLIANGPC	Server Type: 0x00011203, Workstation, Server, Print, NT Workstation, Potential Browser / Using Dropbox's LAN sync feature	Host Announcement using BROWSER / Messages using Dropbox LAN Sync Discovery Protocol	HP device / Windows 7 or Windows Server 2008 R2	3

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.179.159	JXING	Supporting UPnP through QQ Music / Server Type: 0x00011203, Workstation, Server, Print, NT Workstation, Potential Browser	SSDP messages / Host Announcement using BROWSER	HP device	2
147.8.179.162	–	–	Referred by ARP broadcast (requested by 147.8.178.15)	–	3
147.8.179.163	LZHANG3PC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser	Host Announcement using BROWSER	Windows 7 or Windows Server 2008 R2 / HP device	3
147.8.179.165	JXWANGPC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser / Using Dropbox's LAN sync feature	Host Announcement using BROWSER / Messages using Dropbox LAN Sync Discovery Protocol	HP device / Windows 7 or Windows Server 2008 R2	3
147.8.179.167	PGPC159F	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser	Host Announcement using BROWSER	Windows 7 or Windows Server 2008 R2 / HP device	3
147.8.179.198	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	Dell device	3
147.8.179.205	–	Using Dropbox's LAN sync feature / Running multiple services (e.g., media server, connection manager)	Messages using Dropbox LAN Sync Discovery Protocol and SSDP	Device from LCFC(HeFei) Electronics Technology co., ltd / Windows 8.1	3

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.179.210	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	Device from RAD- STONE TECHNOL- OGY	3
147.8.179.217	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	Dell device	3
147.8.179.224	WZHANG2PC	Server Type: 0x00011007, Workstation, Server, SQL, NT Workstation, Potential Browser	Host Announcement using BROWSER	Windows 7 or Windows Server 2008 R2 / HP device	3
147.8.179.225	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	Dell device	3
147.8.179.227	–	Using Dropbox's LAN sync feature / Looking for ONWITH.NET and xn-7ou354dv5jrrc	Messages using Dropbox LAN Sync Discovery Protocol, NBNS and LLMNR	HP device	3
147.8.179.228	HPANPC	Server Type: 0x00001003, Workstation, Server, NT Workstation / Searching for Internet Gateway Device	Host Announcement using BROWSER / SSDP messages	Windows XP / Dell device	3
147.8.179.231	–	Multiple UDP packet from port 8889 to 224.0.0.88:8000 every 10s, the TTL is larger than 1 (maybe misconfiguration)	UDP packets	Dell device	3
147.8.179.235	YTYUEPC	Server Type: 0x00011007, Workstation, Server, SQL, NT Workstation, Potential Browser / Using Dropbox's LAN sync feature	Host Announcement using BROWSER / Messages using Dropbox LAN Sync Discovery Protocol	HP device / Windows 7 or Windows Server 2008 R2	3
147.8.179.236	–	Using Dropbox's LAN sync feature	Messages using Dropbox LAN Sync Discovery Protocol	HP device	3

Table 3: Evidence Table (Public IP Addresses and Multicast Addresses) (Continued)

IP Address	Host Name	Function	Digital Evidence	Type	Priority
147.8.179.240	YPLIPC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser / Searching for Internet Gateway Device	Host Announcement using BROWSER / SSDP messages	Windows 7 or Windows Server 2008 R2 / HP device	3
147.8.179.242	GMJINGPC	Server Type: 0x00011003, Workstation, Server, NT Workstation, Potential Browser / Using Dropbox's LAN sync feature	Host Announcement using BROWSER / Messages using Dropbox LAN Sync Discovery Protocol	HP device / Windows 7 or Windows Server 2008 R2	3
147.8.179.244	–	Sending messages to probable HP printers	UDP broadcast packets to port 3702	HP device	3
147.8.179.245	GBLI-PC	Server Type: 0x00011007, Workstation, Server, SQL, NT Workstation, Potential Browser	Host Announcement using BROWSER	Windows 7 or Windows Server 2008 R2 / HP device	3
147.8.179.254	NPIA4138B.local	Printer	mDNS messages	HP LaserJet P3005	3
147.8.179.255	–	Broadcast address of 147.8.176.0 /22	–	–	3
147.8.255.255	–	Broadcast address of 147.8.0.0 /16	–	–	3
224.0.0.1	–	Used by BJNP (Canon printer command)	–	–	3
224.0.0.88	–	Reserved for multicast addresses	–	–	3
224.0.0.251	–	Used by mDNS	–	–	3
224.0.0.252	–	Used by Link-Local Multicast Name Resolution (LLMNR)	–	–	3
224.0.1.60	–	Used by Service Location Protocol (SRVLOC)	–	–	3
239.235.0.8	–	Multicast	–	–	3
